**Programming** (Figs. 4 and 5)

**Programming of transducer can be done in three ways :**

1) Programming Via Front LCD & two keys.

2) Programming Via optional RS485(MODBUS) communication port.
   (Device address, PT Ratio, CT Ratio, Password, communication parameter, Output Type & simulation mode can be programmed).

3) Programming Via Programming port available at front of RISH CON Transducers using optional PRKAB601 Adapter.

**Programming Via Programming port (COM)**

A PC with RS 232 C interface along with the programming cable PRKAB 601 and the configuration software are required to Program the transducer.

**The connections between**

PC ← PRKAB 601 ← Rish CON Transducer.

The power supply must be applied to Transducer before it can be programmed.

**The Configuration software is supplied on a CD.**

The programming cable PRKAB601 adjusts the signal level and provides the electrical insulation between the PC and RISH CON Transducers.

**Configuring Rish Con Transducer :**

To configure RISH CON Transducer Input / output one of the three programming methods can be adapted along with mechanical switch setting (DIP switch setting on PCB).

**DIP Switch Setting for OUTPUT :**

Type of output (current or voltage signal) has to be set by DIP switch (see Fig.5).

For programming of DIP switch the user needs to open the transducer housing & set the DIP switch located on PCB to the desired output type Voltage or Current. Output range changing is not possible with DIP switch setting.

Refer below Fig. 5 for DIP switch setting.

The four pole DIP switch is located on the PCB in the RISH CON Transducer
