Programmable Tap position transducer

with dual output, display and modbus

RoHS CE

Measure Control Record Analyze Optimize

Application

The purpose of theTap position transducer is to convert tap position of transformers to equivalent analogue output. Outputs can be given as input to either RTU or indicator or recording instrument.

Input variable and measuring range are programmed with the aid of a PC and the configuration software.

The device has one input channel and two independent outputs and Modbus (RS 485) interface . Input variables and measuring range are also programmable through keys and Modbus .

Features / Benefits

1. Input measuring range can be programmed using PC (config soft) / Simplifies project planning and engineering (the final range can be determined during commissioning).
2. Input measuring range can be programmed through modbus and keys.
3. Tap number is programmable from 0 to 101 using software.
4. Tap position is displayed on front LED display and on Modbus.
5. Analogue output signal also programmed using the PC (config-software) , Modbus and keys.
   (impressed current or superimposed voltage for all ranges between–20 and + 20 mADC resp.–12 and + 15 V DC)
6. Galvanic and optical isolation between Power supply, Input and outputs
7. 3,4 wire measurement to compensate lead resistance automatically.
8. 2 wire measurement with lead resistance compensation through software.
9. Tap counter (number of tap changed) can be viewed on Modbus.

Function

Tap position transducers receives resistance input, which corresponds to tap position of transformer. Output is proportional to tap position. Tap number is shown on display and modbus. Tap counter increments by one count on tap change (shown on modbus.)

Electric Isolation

Electrically isolated analog outputs prevent interference voltage and current. Solves grounding problem in meshed signal networks. High electric isolation between input and output–2.3 kV, and power supply versus all other circuits–3.7 kV.
